

# Bessel $F$ -isocrystals for reductive groups

Daxin Xu

Morningside center of Mathematics, Chinese Acad. Sci.

Based on joint works with Xinwen Zhu/ with Masoud Kamgarpour, Lingfei Yi

April 28, 2022

# Outline

- Part I: Kloosterman sum and its generalizations
- Part II: Bessel connection and hypergeometric connection
- Part III: Frobenius structure on connection

# Exponential sums

Exponential sums are any type of finite sums of complex numbers

$$S = \sum_{n=1}^N \exp(2\pi i \theta_n), \quad \theta_n \in \mathbb{R}.$$

They play an important role in number theory.

## Question

What is the value of  $S$  / magnitude of  $|S|$  ?

Trivial one:  $|S| \leq N$ .

# Kloosterman sum

The Kloosterman sum is defined for an integer  $n \geq 2$ , a prime  $p$  and  $a \in \mathbb{F}_p^\times$  by

$$\text{Kl}(n, a) = \sum_{x_i \in \mathbb{F}_p^\times} \exp\left(\frac{2\pi i}{p} \left(x_1 + x_2 + \cdots + x_{n-1} + \frac{a}{x_1 \cdots x_{n-1}}\right)\right).$$

# Kloosterman sum

The Kloosterman sum is defined for an integer  $n \geq 2$ , a prime  $p$  and  $a \in \mathbb{F}_p^\times$  by

$$\text{Kl}(n, a) = \sum_{x_i \in \mathbb{F}_p^\times} \exp\left(\frac{2\pi i}{p} \left(x_1 + x_2 + \cdots + x_{n-1} + \frac{a}{x_1 \cdots x_{n-1}}\right)\right).$$

- $\text{Kl}(2, a)$  first appeared in Fourier expansion of Poincaré series (Poincaré, 1912).
- Kloosterman (1924) obtained a (rough) estimate

$$|\text{Kl}(2, a)| \leq 2p^{3/4}.$$

- Further estimation are studied by Carlitz, Salié, Weil and etc.

# Weil bound and equidistribution law

- The best estimate (called *Weil bound*) was obtained by Weil (n=2, 1948) and Deligne (1977):

$$| \text{Kl}(n, a) | \leq np^{(n-1)/2}.$$

# Weil bound and equidistribution law

- The best estimate (called *Weil bound*) was obtained by Weil ( $n=2$ , 1948) and Deligne (1977):

$$|\text{Kl}(n, a)| \leq np^{(n-1)/2}.$$

- *Equidistribution law* (Deligne and Katz).

For example ( $n = 2$ ), one can define an angle  $\theta(a) \in [0, \pi]$ :

$$2p^{1/2} \cos(\theta(a)) = -\text{Kl}(2, a) \in \mathbb{R} \cap \overline{\mathbb{Q}}.$$

Then:

$$\lim_{p \rightarrow +\infty} \frac{\#\{a \in \mathbb{F}_p^\times, \alpha \leq \theta(a) \leq \beta\}}{p-1} = \frac{2}{\pi} \int_{\alpha}^{\beta} \sin^2 \theta d\theta.$$

## Theorem (Deligne, SGA 4.5 (1977))

*There exists an  $\ell$ -adic local system  $Kl_n$  of rank  $n$  on  $\mathbb{G}_{m, \mathbb{F}_p}$ , called Kloosterman sheaf, such that*

(1) *For any closed point  $a \in \mathbb{G}_m(\mathbb{F}_p) = \mathbb{F}_p^\times$ ,*

$$\mathrm{Tr}(\mathrm{Frob}_a, Kl_{n, \bar{a}}) = Kl(n, a).$$

(2)  *$Kl_n$  is pure of weight  $n - 1$  (i.e. each Frobenius eigenvalue at each closed point of  $\mathbb{G}_m(\mathbb{F}_p)$  has absolute value  $p^{\frac{n-1}{2}}$ ).*

The Weil bound  $|Kl(n, a)| \leq np^{\frac{n-1}{2}}$  follows from (1-2).

## Theorem (Deligne, SGA 4.5 (1977))

There exists an  $\ell$ -adic local system  $Kl_n$  of rank  $n$  on  $\mathbb{G}_{m, \mathbb{F}_p}$ , called Kloosterman sheaf, such that

(1) For any closed point  $a \in \mathbb{G}_m(\mathbb{F}_p) = \mathbb{F}_p^\times$ ,

$$\mathrm{Tr}(\mathrm{Frob}_a, Kl_{n, \bar{a}}) = Kl(n, a).$$

(2)  $Kl_n$  is pure of weight  $n - 1$  (i.e. each Frobenius eigenvalue at each closed point of  $\mathbb{G}_m(\mathbb{F}_p)$  has absolute value  $p^{\frac{n-1}{2}}$ ).

The Weil bound  $|Kl(n, a)| \leq np^{\frac{n-1}{2}}$  follows from (1-2).

Katz (1990) calculated its monodromy group (which implies the equidistribution law)

$$G_{\mathrm{geo}}(Kl_n) = \begin{cases} \mathrm{Sp}_n & n \text{ even,} \\ \mathrm{SL}_n & p, n \text{ odd,} \\ \mathrm{SO}_n & p = 2, n \text{ odd, } n \neq 7, \\ G_2 & p = 2, n = 7. \end{cases}$$

# Hypergeometric sums/sheaves, after Katz

- $\psi = \exp(\frac{2\pi i}{p} -) : \mathbb{F}_p \rightarrow \mathbb{C}^\times$  additive characters;
- $n \geq m$  two integers,  $\underline{\chi} = (\chi_1, \dots, \chi_n)$ ,  $\underline{\rho} = (\rho_1, \dots, \rho_m)$  two pairs of multiplicative characters  $\mathbb{F}_p^\times \rightarrow \mathbb{C}^\times$ .

# Hypergeometric sums/sheaves, after Katz

- $\psi = \exp(\frac{2\pi i}{p} -) : \mathbb{F}_p \rightarrow \mathbb{C}^\times$  additive characters;
- $n \geq m$  two integers,  $\underline{\chi} = (\chi_1, \dots, \chi_n)$ ,  $\underline{\rho} = (\rho_1, \dots, \rho_m)$  two pairs of multiplicative characters  $\mathbb{F}_p^\times \rightarrow \mathbb{C}^\times$ .
- For  $a \in \mathbb{F}_p^\times$ , hypergeometric sum  $\text{Hyp}^{(n,m)}(\psi; \underline{\chi}; \underline{\rho})(a) =$

$$\sum_{x_1 \cdots x_n = ay_1 \cdots y_m} \psi \left( \sum_{i=1}^n x_i - \sum_{i=1}^m y_i \right) \prod_{i=1}^n \chi_i(x_i) \prod_{i=1}^m \rho_i(y_i^{-1}).$$

When  $\chi_i = 1$  are trivial,  $m = 0$ , it recovers Kloosterman sum.

# Hypergeometric sums/sheaves, after Katz

- $\psi = \exp(\frac{2\pi i}{p} -) : \mathbb{F}_p \rightarrow \mathbb{C}^\times$  additive characters;
- $n \geq m$  two integers,  $\underline{\chi} = (\chi_1, \dots, \chi_n)$ ,  $\underline{\rho} = (\rho_1, \dots, \rho_m)$  two pairs of multiplicative characters  $\mathbb{F}_p^\times \rightarrow \mathbb{C}^\times$ .
- For  $a \in \mathbb{F}_p^\times$ , hypergeometric sum  $\text{Hyp}^{(n,m)}(\psi; \underline{\chi}; \underline{\rho})(a) =$

$$\sum_{x_1 \cdots x_n = ay_1 \cdots y_m} \psi \left( \sum_{i=1}^n x_i - \sum_{i=1}^m y_i \right) \prod_{i=1}^n \chi_i(x_i) \prod_{i=1}^m \rho_i(y_i^{-1}).$$

When  $\chi_i = 1$  are trivial,  $m = 0$ , it recovers Kloosterman sum.

- Katz defined its sheaf-theoretic incarnation, obtained the Weil bound: if  $\chi_i, \rho_j$  are non-isomorphic  $\forall i, j$ , then

$$|\text{Hyp}^{(n,m)}(\psi; \underline{\chi}; \underline{\rho})(a)| \leq np^{(n+m-1)/2},$$

and also the equidistribution law in many cases.

# Heinloth-Ngô-Yun's Kloosterman sheaves for reductive groups

- Heinloth-Ngô-Yun reinterpreted the construction of  $Kl_n$  in the context of (geometric) Langlands program over the function field  $\mathbb{F}_p(t)$  (for  $GL_n$ ) and generalised it for reductive groups.

# Heinloth-Ngô-Yun's Kloosterman sheaves for reductive groups

- Heinloth-Ngô-Yun reinterpreted the construction of  $Kl_n$  in the context of (geometric) Langlands program over the function field  $\mathbb{F}_p(t)$  (for  $GL_n$ ) and generalised it for reductive groups.
- Let  $F$  be a global function field  $\mathbb{F}_p(X)$  of a smooth curve  $X$ . The Langlands program relates
  - Automorphic forms: e.g.  $f : GL_n(F) \backslash GL_n(\mathbb{A}_F) \rightarrow \overline{\mathbb{Q}}_\ell$ .
  - Galois representations: e.g.  $\rho : \text{Gal}(\overline{F}/F) \rightarrow GL_n(\overline{\mathbb{Q}}_\ell)$ .  
(Regard it as:  $\ell$ -adic local system on an open subset  $U$  of  $X$ ).
- The Langlands program involves reductive groups.  
Let  $G$  be a reductive group over  $\mathbb{F}_p$  and  $\check{G}$  the Langlands dual group of  $G$ . e.g.

$$G = GL_n, SO_{2n+1}, SO_{2n}, \quad \check{G} = GL_n, Sp_{2n}, SO_{2n}.$$

- Heinloth-Ngô-Yun explicitly constructed an automorphic form  $f$  (Hecke eigenform) on  $G$  over  $\mathbb{F}_p(t)$ , which is
  - unramified on  $\mathbb{G}_m$ ;
  - Steinberg representation at 0;
  - simple supercuspidal at  $\infty$  (Gross-Reeder).

- Heinloth-Ngô-Yun explicitly constructed an automorphic form  $f$  (Hecke eigenform) on  $G$  over  $\mathbb{F}_p(t)$ , which is
  - unramified on  $\mathbb{G}_m$ ;
  - Steinberg representation at 0;
  - simple supercuspidal at  $\infty$  (Gross-Reeder).
- (i) Geometrize  $f$  as an automorphic sheaf  $\text{Aut}_f$  on the moduli stack of  $G$ -bundles on  $\mathbb{P}^1$  with certain level structures;
- (ii) Define *the Kloosterman sheaf*  $\text{Kl}_{\check{G}}$  of  $\check{G}$  as the Langlands parameter associated to  $\text{Aut}_f$ .

It is an  $\ell$ -adic  $\check{G}$ -local system on  $\mathbb{G}_m$ :

$$\begin{aligned} \text{Kl}_{\check{G}} : \mathbf{Rep}(\check{G}) &\rightarrow \text{LocSysm}(\mathbb{G}_m, \mathbb{F}_p), & \text{Kl}_{\check{G}} : \pi_1(\mathbb{G}_m, \mathbb{F}_p) &\rightarrow \check{G}(\overline{\mathbb{Q}}_\ell) \\ V &\mapsto \text{Kl}_{\check{G}, V}. \end{aligned}$$

When  $\check{G} = \text{GL}_n, \text{SL}_n$ ,  $\text{Kl}_{\text{GL}_n, \text{Std}} = \text{Kl}_{\text{SL}_n, \text{Std}} = \text{Kl}_n$ .

- Heinloth-Ngô-Yun explicitly constructed an automorphic form  $f$  (Hecke eigenform) on  $G$  over  $\mathbb{F}_p(t)$ , which is
  - unramified on  $\mathbb{G}_m$ ;
  - Steinberg representation at 0;
  - simple supercuspidal at  $\infty$  (Gross-Reeder).
- (i) Geometrize  $f$  as an automorphic sheaf  $\text{Aut}_f$  on the moduli stack of  $G$ -bundles on  $\mathbb{P}^1$  with certain level structures;
- (ii) Define *the Kloosterman sheaf*  $\text{Kl}_{\check{G}}$  of  $\check{G}$  as the Langlands parameter associated to  $\text{Aut}_f$ .

It is an  $\ell$ -adic  $\check{G}$ -local system on  $\mathbb{G}_m$ :

$$\begin{aligned} \text{Kl}_{\check{G}} : \mathbf{Rep}(\check{G}) &\rightarrow \text{LocSyst}(\mathbb{G}_m, \mathbb{F}_p), & \text{Kl}_{\check{G}} : \pi_1(\mathbb{G}_m, \mathbb{F}_p) &\rightarrow \check{G}(\overline{\mathbb{Q}}_\ell) \\ V &\mapsto \text{Kl}_{\check{G}, V}. \end{aligned}$$

When  $\check{G} = \text{GL}_n, \text{SL}_n$ ,  $\text{Kl}_{\text{GL}_n, \text{Std}} = \text{Kl}_{\text{SL}_n, \text{Std}} = \text{Kl}_n$ .

- Taking Frobenius traces, one obtain exponential sums

$$\text{Kl}_{\check{G}, V}(-) : \mathbb{F}_p^\times \rightarrow \mathbb{C}$$

satisfying certain Weil bound and equidistribution law.

# Explicit exponential sums

For  $a \in \mathbb{F}_p^\times$

(i) (Kloosterman sum)  $\text{Kl}_{\text{GL}_n, \text{Std}}(a) = \text{Kl}_{\text{SL}_n, \text{Std}}(a) = \text{Kl}(n, a)$

$$= \sum_{x_i \in \mathbb{F}_p^\times} \exp\left(\frac{2\pi i}{p} \left(x_1 + x_2 + \cdots + x_{n-1} + \frac{a}{x_1 \cdots x_{n-1}}\right)\right),$$

(ii)  $\text{Kl}_{\text{Sp}_{2n}, \text{Std}} = \text{Kl}_{\text{GL}_{2n}, \text{Std}},$

Weil bounds:

$$|\text{Kl}_{\text{SO}_{2n+1}, \text{Std}}| \leq (2n+1)p^n, \quad |\text{Kl}_{\text{SO}_{2n+2}, \text{Std}}| \leq (2n+2)p^n.$$

# Questions

- (i) What is the (geometric) monodromy group  $G_{\text{geo}}(\text{Kl}_{\check{G}})$  of  $\text{Kl}_{\check{G}}$ ?  
(What is its equidistribution law?)
- $G_{\text{geo}}(\text{Kl}_{\check{G}}) :=$  Zariski closure of  $\text{Kl}_{\check{G}} : \pi_1^{\text{ét}}(\mathbb{G}_m, \overline{\mathbb{F}}_p) \rightarrow \check{G}(\overline{\mathbb{Q}}_\ell)$ .
- (ii) (Conjecture of Heinloth-Ngô-Yun).  
Functorial properties of  $\text{Kl}_{\check{G}}$ .  
(Roughly speaking, we can identify certain exponential sums for different groups.)

Above two questions are solved in my joint work with Xinwen Zhu from the  $p$ -adic/de Rham aspect of this story.

(Roughly speaking, we can identify certain exponential sums for different groups.)

Above two questions are solved in my joint work with Xinwen Zhu from the  $p$ -adic/de Rham aspect of this story.

- (iii) Generalizations of hypergeometric sheaves for reductive groups.

With Masoud Kamgarpour, Lingfei Yi, we obtain generalizations for classical groups using geometric Langlands correspondence.

## Theorem

If  $\check{G}$  is almost simple, then the monodromy groups of  $\text{Kl}_{\check{G}}$  are connected and of following type:

| $\check{G}$                                       | $G_{\text{geo}}(\text{Kl}_{\check{G}}) \hookrightarrow \check{G}$ |
|---|---|
| $A_{2n}(p > 2)$                                   | $A_{2n}$  |
| $A_{2n-1}, C_n$                                   | $C_n$   |
| $A_{2n}(p = 2, n \neq 3), B_n, D_{n+1}(n \geq 4)$ | $B_n$   |
| $E_7$   | $E_7$   |
| $E_8$   | $E_8$   |
| $E_6, F_4$  | $F_4$   |
| $A_6(p = 2), B_3, D_4, G_2$                       | $G_2$   |

Type A: Katz;

HNY obtain this result except some small characteristic cases;

With Xinwen Zhu, we provide a new proof from the  $p$ -adic aspect.

## Theorem (Functoriality conjecture, X.-Zhu)

If  $\check{H} \subset \check{G}$  in the same line of the above table, one can identify  $\text{Kl}_{\check{G}}, \text{Kl}_{\check{H}}$  by pushout, i.e.

$$\text{Kl}_{\check{G}} = \text{Kl}_{\check{H}} \circ \iota : \mathbf{Rep}(\check{G}) \rightarrow \mathbf{Rep}(\check{H}) \rightarrow \text{LocSys}(\mathbb{G}_{m, \mathbb{F}_p}).$$

This allows us to identify different exponential sums:

## Theorem (Functoriality conjecture, X.-Zhu)

If  $\check{H} \subset \check{G}$  in the same line of the above table, one can identify  $\text{Kl}_{\check{G}}, \text{Kl}_{\check{H}}$  by pushout, i.e.

$$\text{Kl}_{\check{G}} = \text{Kl}_{\check{H}} \circ \iota : \mathbf{Rep}(\check{G}) \rightarrow \mathbf{Rep}(\check{H}) \rightarrow \text{LocSyst}(\mathbb{G}_{m, \mathbb{F}_p}).$$

This allows us to identify different exponential sums:

- $\text{Kl}_{\text{SO}_{2n+2}, \text{Std}}(a) - p^n = \text{Kl}_{\text{SO}_{2n+1}, \text{Std}}(a),$
- if  $p = 2, \text{Kl}_{\text{SO}_{2n+1}, \text{Std}}(a) = \text{Kl}(2n+1, a),$
- if  $p > 2, \text{Kl}_{\text{SO}_{2n+1}, \text{Std}}(a)$  is equal to  $\text{Hyp}^{(2n+1, 1)}(\psi; \underline{1}; \rho) =$

$$\frac{\sum_{x_i \in \mathbb{F}_p^\times} \exp\left(\frac{2\pi i}{p} \left(x_1 + x_2 + \cdots + x_{2n+1} - \frac{x_1 \cdots x_{2n+1}}{4a}\right)\right) \rho\left(\frac{x_1 \cdots x_{2n+1}}{4a}\right)}{G(\rho)}$$

Here  $\rho$  is the quadratic character,  $G(\rho)$  Gauss sum.

Our proof studies *Frobenius structure* on differential equations.

# Bessel differential equation

- The classical Bessel differential equation with a parameter  $\lambda$

$$\text{Be}_2 : \left( x \frac{d}{dx} \right)^2 (f) - \lambda^2 x \cdot f = 0$$

admits a unique holomorphic solution on  $\mathbb{C}$  :

$$\frac{1}{2\pi i} \int_{S^1} \exp \lambda \left( z + \frac{x}{z} \right) \frac{dz}{z} = \sum_{r \geq 0} \frac{\lambda^{2r}}{(r!)^2} x^r.$$

# Bessel differential equation

- The classical Bessel differential equation with a parameter  $\lambda$

$$\text{Be}_2 : \left( x \frac{d}{dx} \right)^2 (f) - \lambda^2 x \cdot f = 0$$

admits a unique holomorphic solution on  $\mathbb{C}$  :

$$\frac{1}{2\pi i} \int_{S^1} \exp \lambda \left( z + \frac{x}{z} \right) \frac{dz}{z} = \sum_{r \geq 0} \frac{\lambda^{2r}}{(r!)^2} x^r.$$

- This integration can be viewed as a continuous analogue of the discrete Kloosterman sums

$$\text{Kl}(2, a) = \sum_{z \in \mathbb{F}_p^\times} \exp \left( \frac{2\pi i}{p} \left( z + \frac{a}{z} \right) \right).$$

# Bessel connection for reductive groups

- $K$  a field of characteristic 0,  
 $\check{G}$  a split reductive group of rank  $r$ ,  $\check{T} \subset \check{B} \subset \check{G}$ ,  
 $\check{\mathfrak{g}}$  its Lie algebra,  $h$  its Coxeter number.

$$\rightsquigarrow \left( x \frac{d}{dx} \right)^{2n+1} (f) - \lambda^{2n} x (4x \frac{d}{dx} + 2) \cdot f = 0.$$

# Hypergeometric connection for classical groups

- $\check{G}$  a classical group of rank  $r$ :  $SL_{r+1}$ ,  $SO_{2r+1}$ ,  $Sp_{2r}$ ,  $SO_{2r+2}$ ,  
 $\check{\mathfrak{g}} = \mathfrak{n}^- \oplus \mathfrak{t} \oplus \mathfrak{n}$ , such that  $p_{-1} \in \mathfrak{n}^-$ .
- $2\check{\rho}$  = sum of all positive roots.
- $\{p_{-1}, 2\check{\rho}, p_1\}$  a principal  $\mathfrak{sl}_2 \subset \check{\mathfrak{g}}$ ,  $p_1 \in \mathfrak{n}^{p_1} \subset \mathfrak{n}$ .

# Hypergeometric connection for classical groups

- $\check{G}$  a classical group of rank  $r$ :  $SL_{r+1}$ ,  $SO_{2r+1}$ ,  $Sp_{2r}$ ,  $SO_{2r+2}$ ,  
 $\check{\mathfrak{g}} = \mathfrak{n}^- \oplus \mathfrak{t} \oplus \mathfrak{n}$ , such that  $p_{-1} \in \mathfrak{n}^-$ .
- $2\check{\rho}$  = sum of all positive roots.
- $\{p_{-1}, 2\check{\rho}, p_1\}$  a principal  $\mathfrak{sl}_2 \subset \check{\mathfrak{g}}$ ,  $p_1 \in \mathfrak{n}^{p_1} \subset \mathfrak{n}$ .
- $\{d_1, \dots, d_r\}$  degrees of fundamental invariant of  $\check{\mathfrak{g}}$ .
- $\{p_1, \dots, p_r\}$  a homogeneous basis  $\mathfrak{n}^{p_1}$  with  $\deg(p_i) = d_i - 1$ .
- Fix a fundamental degree  $d > \frac{h}{2}$ , we consider  $\check{G}$ -connection:

$$\text{Hyp}_{\check{G}}(\underline{\lambda}) = d + (p_{-1} + \sum_{d_i \geq d} \lambda_i p_i x) \frac{dx}{x}, \quad \lambda_i \in K.$$

# Hypergeometric connection for classical groups

For  $\check{G} = \mathrm{SL}_{r+1}$ , fundamental degrees  $\{2, 3, \dots, r+1\}$ .

We take  $p_{-1}, p_1$  as follows and  $p_k = p_1^k$ ,  $k = 1, \dots, r$ .

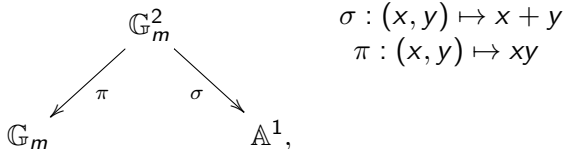

$$p_{-1} = \begin{pmatrix} 0 & \dots & & 0 & 0 \\ 1 & \ddots & & & 0 \\ 0 & 1 & \ddots & & \vdots \\ \vdots & & \ddots & 0 & \vdots \\ 0 & & \dots & 1 & 0 \end{pmatrix}, \quad p_1 = \begin{pmatrix} 0 & r & \dots & 0 & 0 \\ \vdots & 0 & 2(r-1) & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & & 0 & r \\ 0 & 0 & \dots & \dots & 0 \end{pmatrix}$$

Hypergeometric connection  $\mathrm{Hyp}_{\check{G}}(\underline{\lambda})_{\mathrm{Std}} \rightsquigarrow$  hypergeometric differential equation (Katz):

$$\left(x \frac{d}{dx}\right)^n (f) - x \left(\sum_{i=0}^m \mu_i \left(x \frac{d}{dx}\right)^i\right) (f) = 0, \quad \mu_i \in K.$$

# Be<sub>2</sub> vs Kl<sub>2</sub>

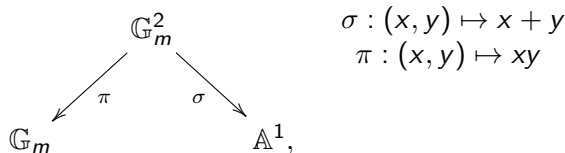

- Kl<sub>2</sub>:  $\mathcal{L}_\psi$ : Artin-Scheier sheaf  $\pi_1(\mathbb{A}_{\mathbb{F}_p}^1) \rightarrow \mathbb{F}_p \xrightarrow{\psi} \overline{\mathbb{Q}}_\ell^\times$ .

$$\text{Kl}_2 := R^1 \pi_!(\sigma^*(\mathcal{L}_\psi)) \xrightarrow{\sim} R^1 \pi_*(\sigma^*(\mathcal{L}_\psi))$$

# Be<sub>2</sub> vs Kl<sub>2</sub>

- Kl<sub>2</sub>:  $\mathcal{L}_\psi$ : Artin-Scheier sheaf  $\pi_1(\mathbb{A}_{\mathbb{F}_p}^1) \rightarrow \mathbb{F}_p \xrightarrow{\psi} \overline{\mathbb{Q}}_\ell^\times$ .

$$\text{Kl}_2 := R^1 \pi_!(\sigma^*(\mathcal{L}_\psi)) \xrightarrow{\sim} R^1 \pi_*(\sigma^*(\mathcal{L}_\psi))$$

- Let  $K$  be a field of characteristic zero. Exponential  $\mathcal{D}$ -module  $e^{\lambda x} = (\mathcal{O}_{\mathbb{A}^1}, \nabla = d - \lambda dx)$  on  $\mathbb{A}_K^1$ , where  $\lambda$  is a parameter in  $K$ , is an analogue of Artin-Scheier sheaf.
- The Bessel equation: connection on  $\mathbb{G}_{m,K}$ :

$$\text{Be}_2 = d + \begin{pmatrix} 0 & \lambda^2 x \\ 1 & 0 \end{pmatrix} \frac{dx}{x}.$$

Then we have  $R^1 \pi_!(\sigma^*(e^{\lambda x})) \simeq \text{Be}_2$  as algebraic  $\mathcal{D}$ -modules.

# Frobenius structure on $\text{Be}_2$

- (Dwork)  $K = \mathbb{Q}_p(\lambda)$ . Frobenius pullback by  $x \mapsto x^p$  on  $\mathbb{A}_K^1$ ,  

$$e^{\lambda x} = d - \lambda dx \mapsto d - p\lambda x^{p-1} dx.$$

# Frobenius structure on $\text{Be}_2$

- (Dwork)  $K = \mathbb{Q}_p(\lambda)$ . Frobenius pullback by  $x \mapsto x^p$  on  $\mathbb{A}_K^1$ ,  

$$e^{\lambda x} = d - \lambda dx \mapsto d - p\lambda x^{p-1} dx.$$

- $\exists$  "Frobenius structure" on  $e^{\lambda x}$ :  $F_\lambda(x) = e^{\lambda(x^p-x)} \in A^\dagger$  s.t.  

$$\frac{dF_\lambda}{dx} F_\lambda(x)^{-1} + \lambda = p\lambda x^{p-1}, \quad \text{i.e. } F_\lambda : F^*(e^{\lambda x}) \xrightarrow{\sim} e^{\lambda x}.$$

$A^\dagger$  = ring of  $p$ -adic analytic functions on a closed disc of radius  $> 1$  ( $p$ -adic topology),

$$= \bigcup_{r>1} \left( K \left\langle \frac{t}{r} \right\rangle = \left\{ \sum_{i \geq 0} a_i \left( \frac{t}{r} \right)^i \mid |a_i|_p \rightarrow 0 \right\} \right).$$

- A choice of  $\lambda, \lambda^{p-1} = -p \leftrightarrow \psi_\lambda : \mathbb{F}_p \rightarrow K^\times$  s.t. for  $a \in \mathbb{F}_p$ , a Teichmuller lifting  $[a] \in \mathbb{Z}_p$

$$F_\lambda([a]) = \psi_\lambda(a).$$

$K = \mathbb{Q}_p(\lambda)$  with  $\lambda^{p-1} = -p$  s.t.  $\psi_\lambda = \exp(\frac{2\pi i}{p}-)$  via  $K \rightarrow \mathbb{C}$ .

## Theorem (Dwork)

(i) *There exists a unique  $\varphi(x) \in \mathrm{GL}_2(A^\dagger)$  satisfying*

$$x \frac{\partial \varphi}{\partial x} \varphi^{-1} + \varphi \begin{pmatrix} 0 & \lambda^2 x \\ 1 & 0 \end{pmatrix} \varphi^{-1} = p \begin{pmatrix} 0 & \lambda^2 x^p \\ 1 & 0 \end{pmatrix}$$

*That is, a horizontal isomorphism  $\varphi : F^*(\mathrm{Be}_2) \xrightarrow{\sim} \mathrm{Be}_2$ .*

(ii) *For every  $a \in \mathbb{F}_p^\times$ , we have*

$$\mathrm{Tr} \varphi([a]) = \mathrm{Kl}(2, a).$$

(iii) *For every  $a \in \mathbb{F}_p^\times$ , the  $p$ -adic absolute values of two eigenvalues of  $\varphi([a])$  are  $|\alpha|_p = 1$  and  $|\beta|_p = p^{-1}$ . (Behaves like an ordinary elliptic curve /  $\mathbb{F}_p$ .)*

# Frobenius structure on Bessel connection

## Theorem (X.-Zhu)

$K = \mathbb{Q}_p(\lambda)$  with  $\lambda^{p-1} = -p$ .

(i) There exists a unique  $\varphi(x) \in \check{G}(A^\dagger)$  satisfying

$$x \frac{\partial \varphi}{\partial x} \varphi^{-1} + \text{Ad}_\varphi(p_{-1} + \lambda^h x p_r) = p(p_{-1} + \lambda^h x^p p_r),$$

i.e.  $\varphi$  defines a “Frobenius structure” on  $\text{Be}_{\check{G}}$ .

(ii) For every  $a \in \mathbb{F}_p^\times$  and  $V \in \mathbf{Rep}(\check{G})$

$$\text{Tr}(\varphi([a]), \text{Be}_{\check{G}, V}) = \text{Tr}(\text{Frob}_a, (\text{Kl}_{\check{G}, V})_{\bar{a}}).$$

(iii) When  $\check{G}$  is classical or  $G_2$ , the  $p$ -adic absolute values of eigenvalues of  $\varphi([a]) \in \check{G}(K)$  are same as those of  $\check{\rho}(p)$ , where  $\check{\rho} : \mathbb{G}_m \rightarrow \check{T}$  is the half sum of positive roots.

$(\text{Be}_{\check{G}}, \varphi)$  forms a  $p$ -adic  $\check{G}$ -local system  $\text{Be}_{\check{G}}^{\dagger}$  on  $\mathbb{G}_{m, \mathbb{F}_p}$ .  
Based on the calculation of  $G_{\text{diff}}(\text{Be}_{\check{G}})$  (Frenkel-Gross).

## Theorem

*If  $\check{G}$  is almost simple, then the geometric monodromy group of  $\text{Be}_{\check{G}}^{\dagger}$  is connected and of following type:*

| $\check{G}$                                       | $G_{\text{geo}}(\text{Be}_{\check{G}}^{\dagger}) \hookrightarrow \check{G}$ |
|---|---|
| $A_{2n}(p > 2)$                                   | $A_{2n}$  |
| $A_{2n-1}, C_n$                                   | $C_n$   |
| $A_{2n}(p = 2, n \neq 3), B_n, D_{n+1}(n \geq 4)$ | $B_n$   |
| $E_7$   | $E_7$   |
| $E_8$   | $E_8$   |
| $E_6, F_4$  | $F_4$   |
| $A_6(p = 2), B_3, D_4, G_2$                       | $G_2$   |

Recover the calculation of  $G_{\text{geo}}(\text{Kl}_{\check{G}})$  due to Katz and HNY.

## Theorem (Functoriality)

If  $\check{H} \subset \check{G}$  in the same line of the above table, one can identify  $\text{Be}_{\check{G}}^{\dagger}, \text{Be}_{\check{H}}^{\dagger}$  (and hence  $\text{Kl}_{\check{G}}, \text{Kl}_{\check{H}}$ ) by pushout, i.e.

$$\text{Kl}_{\check{G}} = \text{Kl}_{\check{H}} \circ \iota : \mathbf{Rep}(\check{G}) \rightarrow \mathbf{Rep}(\check{H}) \rightarrow \text{LocSys}(\mathbb{G}_m, \mathbb{F}_p).$$

Such a relationship for connections  $\text{Be}_{\check{G}}, \text{Be}_{\check{H}}$  follows from their definition.

Then the assertion follows from the uniqueness of Frobenius structure on  $\text{Be}_{\check{G}}$ .

# Proof of main theorem

- If we apply HNY's construction in the de Rham/  $p$ -adic setting, we obtain a  $\check{G}$ -local system  $Kl_{\check{G}}^{\text{dR}} / Kl_{\check{G}}^{\text{rig}}$ .
- Geometric Satake equivalence for arithmetic  $\mathcal{D}$ -modules.

# Proof of main theorem

- If we apply HNY's construction in the de Rham/  $p$ -adic setting, we obtain a  $\check{G}$ -local system  $Kl_G^{dR} / Kl_G^{rig}$ .
- Geometric Satake equivalence for arithmetic  $\mathcal{D}$ -modules.
- After Beilinson–Drinfeld approach for geometric Langlands correspondence and a variant due to Zhu

$$Be_{\check{G}} \simeq Kl_G^{dR}.$$

# Proof of main theorem

- If we apply HNY's construction in the de Rham/  $p$ -adic setting, we obtain a  $\check{G}$ -local system  $\mathrm{Kl}_{\check{G}}^{\mathrm{dR}} / \mathrm{Kl}_{\check{G}}^{\mathrm{rig}}$ .
- Geometric Satake equivalence for arithmetic  $\mathcal{D}$ -modules.
- After Beilinson–Drinfeld approach for geometric Langlands correspondence and a variant due to Zhu

$$\mathrm{Be}_{\check{G}} \simeq \mathrm{Kl}_{\check{G}}^{\mathrm{dR}}.$$

- For certain algebraic connection, show its (relative) rigid cohomology is isomorphic to its (relative) algebraic de Rham cohomology.  $\exists$  an isomorphism of arithmetic  $\mathcal{D}$ -modules.

$$\left(\mathrm{Be}_{\check{G}}\right)^{\mathrm{an}} \xrightarrow{\sim} \mathrm{Kl}_{\check{G}}^{\mathrm{rig}}.$$

- The Frobenius structure on  $\mathrm{Kl}_{\check{G}}^{\mathrm{rig}}$  gives rise to a Frobenius structure on  $\mathrm{Be}_{\check{G}}$ .

# Hypergeometric sheaves for classical groups

## Theorem (Kamgarpour–X.–L. Yi)

- (i) *There exists an automorphic function (resp. automorphic sheaf on  $\text{Bun}_G$ ), whose Hecke eigenvalue is isomorphic to  $\text{Hyp}_G(\underline{\lambda})$ .*
- (ii) *There exists a Frobenius structure on  $\text{Hyp}_G(\underline{\lambda})$ , whose Frobenius trace are certain hypergeometric sums.*

# Hypergeometric sheaves for classical groups

## Theorem (Kamgarpour–X.–L. Yi)

- (i) *There exists an automorphic function (resp. automorphic sheaf on  $\text{Bun}_G$ ), whose Hecke eigenvalue is isomorphic to  $\text{Hyp}_{\check{G}}(\underline{\lambda})$ .*
- (ii) *There exists a Frobenius structure on  $\text{Hyp}_{\check{G}}(\underline{\lambda})$ , whose Frobenius trace are certain hypergeometric sums.*

- Type A case is due to Kamgarpour–L. Yi.
- Beilinson–Drinfeld's approach for geometric Langlands.
- $\text{Hyp}_{\check{G}}(\underline{\lambda})$  satisfy certain functorial relationship for  $\text{SO}_{2r+1} \rightarrow \text{SL}_{2r+1}$ ,  $\text{Sp}_{2r} \rightarrow \text{SL}_{2r}$ ,  $\text{SO}_{2r+1} \rightarrow \text{SO}_{2r+2}$ , generalizing that of Kloosterman sheaves for reductive groups.

Thank You!
